Company' s Requirement

- 1.Users can log on to the Website, we have a list of our commodity, users can choose according to their preferences and company will based on user' s preference for weekly fish shipment.
- 2.Our system will find out the fish that the user often buy and based on this information we to provide users with relevant information about this fish, such as the source of fish, cooking method etc.,
3. Our system will provide a personalized page. Where possible, customer preferences will be studied on the page, and such profiling used to build personalized pages.

”

Function Module

The screenshot shows a web application interface for user login. At the top, there is a blue header with a logo and a navigation menu containing links for Home Page, News, Product, null, Shopping cart, null, Contact us, and Sign Out. The main content area is titled "user login" and contains three input fields: "userID:", "password:", and "verification code:". Below the verification code field is a CAPTCHA image. At the bottom of the form are buttons for "login", "reset", and "register". The footer of the page includes the same navigation menu and the text "Designed by :Kevin". A hand is shown on the left side, pointing upwards towards the "Function Module" label.

TM: Paging

Web applications commonly use record paging to present large amounts of information to users. For example, an Internet search engine usually returns tens of thousands of results for a user's query. If the engine returned all those results at once, the receiving system would be overwhelmed. But paging breaks the data into fixed-size blocks that make the results manageable and reduces the amount of information that moves between the server and the client at one time. The application gives users only a few records at a time, preferably giving them the most relevant information first. In addition to making the data easier to understand and browse, paging also helps improve application performance—retrieving and displaying large amounts of information creates unnecessary overhead that can slow your system. If the system pages records correctly, a search engine's users likely won't even need to browse beyond the first one or two pages.
