Abstract

The 2007-2010 recession was responsible for huge social and economic upheaval leading to mass redundancies and a record high in unemployment rates for young people to nearly 25%, for those under 25 years of age. Those without further education qualifications were especially hard hit.

The aim of this project was to develop some form of software program that could enable a school leaver (or similar) looking for career guidance, to examine possible choices and pathways. The aim was to develop a mobile application rather than a web-based one that would be uploaded to Google Play store on completion.

The objective in doing so was to meet the client's expectations of providing an accessible user interface that was easy to use and fully functional to produce the correct results. This meant a list of suitably appropriate jobs and work environments based upon the user's answers provided to the occupational questionnaire.

This objective of accomplishing a mobile app for deployment was realised along with the original user requirements being fully met. The app is now available for download from Google Play.
