

# AyeCanChange: A PhoneGap & AWS Application

Claire Lough  
MSc in Information Technology

AyeCanChange supports users to bring about positive change in their lives through diet, exercise and mental well-being. A positive approach is taken to conveying the importance of even the smallest steps.

## Amazon Web Services

- ❖ The App collects user data which can be reviewed to target human intervention.
- ❖ Amazon Web Services was configured to provide backend functionality for the App.
- ❖ Data is stored in an encrypted MySQL database which the App can access using php scripts.
- ❖ SSL was installed to ensure secure transport of user data.

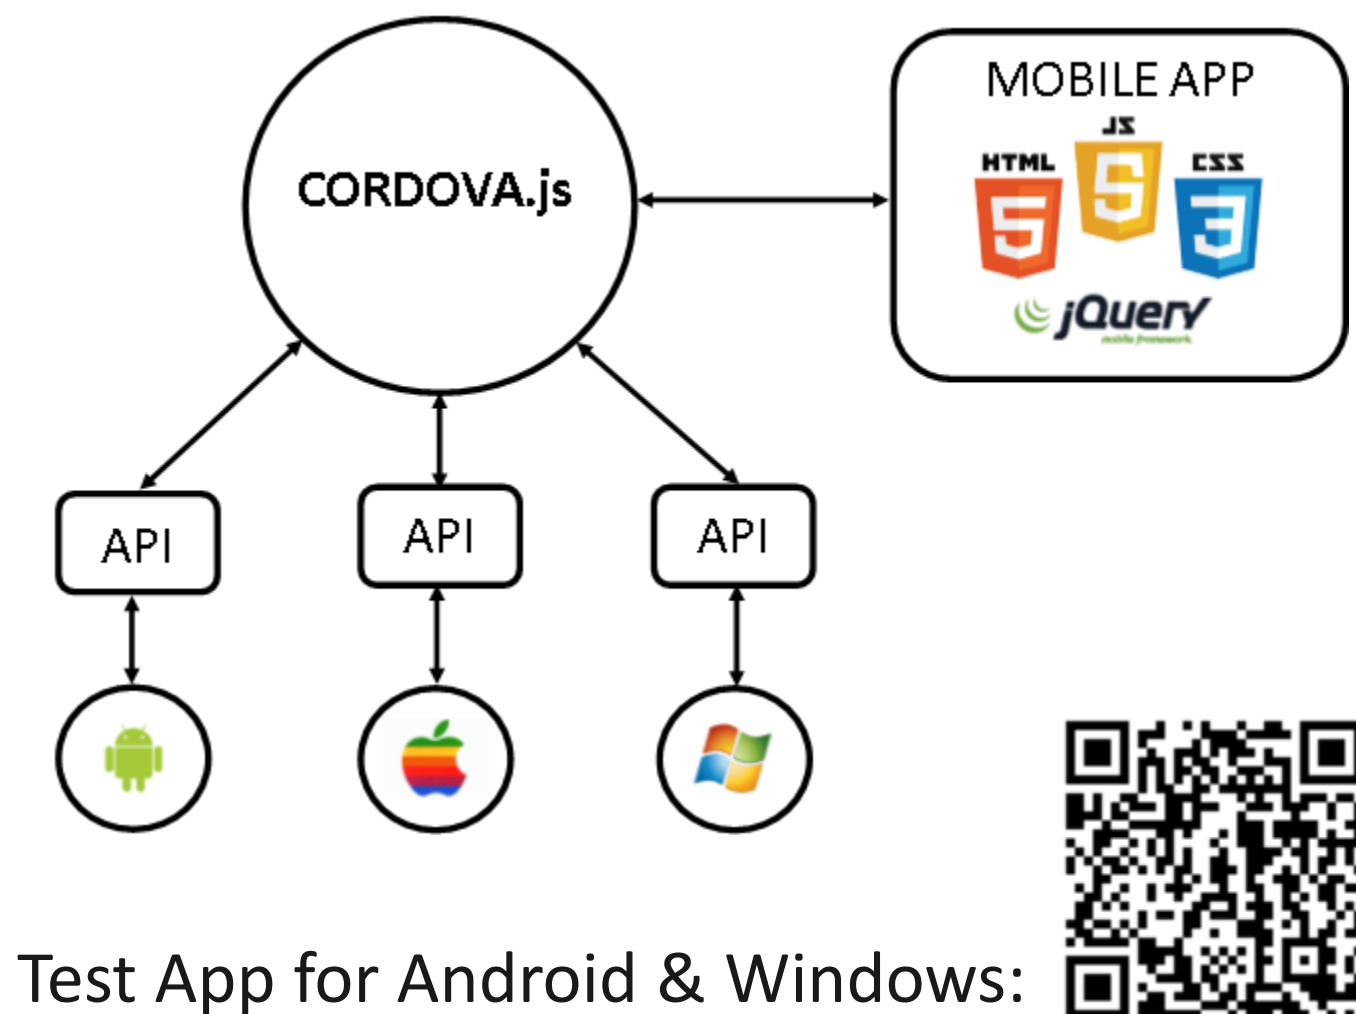

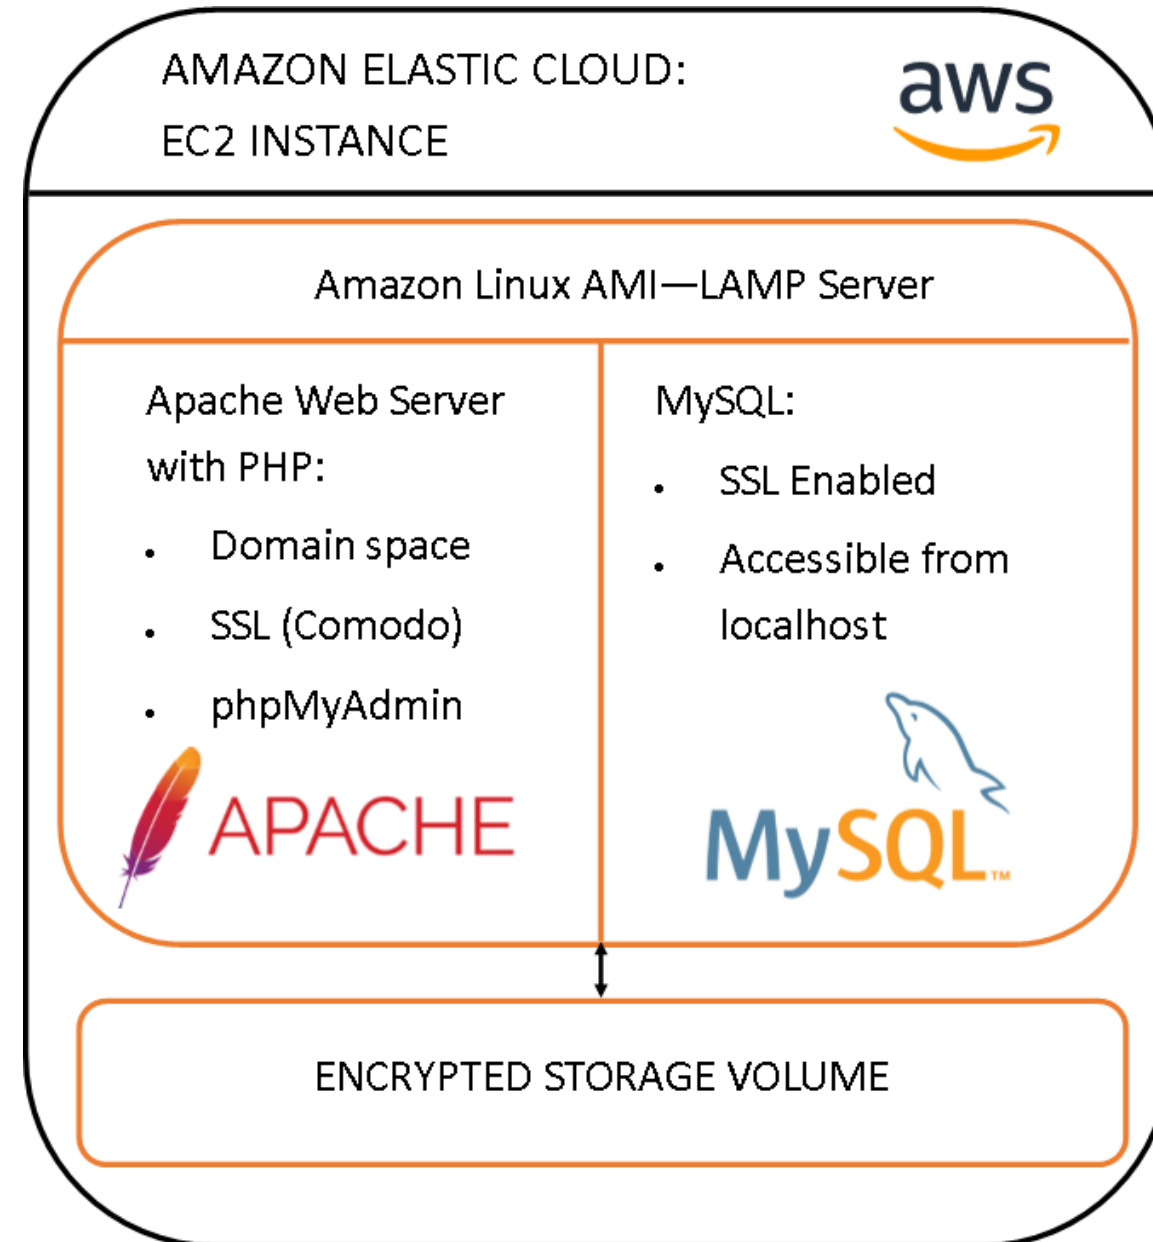

## Cross Platform PhoneGap Application

- ❖ Users are required to register on first use before accessing the content of the App.
- ❖ The App is 'offline-first' by design and is fully functional when internet isn't available. Data is synced when possible.
- ❖ The App uses a dynamic menu option to direct users to each new section of the programme.
- ❖ Each section contains informative videos, quizzes and options for the user to select actions to undertake each week.
- ❖ Users can view their achievements on a dynamic page.
- ❖ The App provides a 'buddy' character for users to interact with. The character thrives on positive user actions.

## PhoneGap Build

- ❖ Using PGB to compile the App ensures the latest versions of Cordova and all Plugins are injected at build time.
- ❖ The App uses Whitelist and WebSQL plugins to access the server and store data locally.
- ❖ When enabled, the PGB 'Hydration' feature will alert users any time a new version of the App becomes available.
- ❖ Compiling the App in the cloud allows for fast and easy distribution to clients.
- ❖ An auto-generated QR code contains a direct link to download the App.

Test App for Android & Windows:
