

InDaChain: The App

Tommaso Caramelli

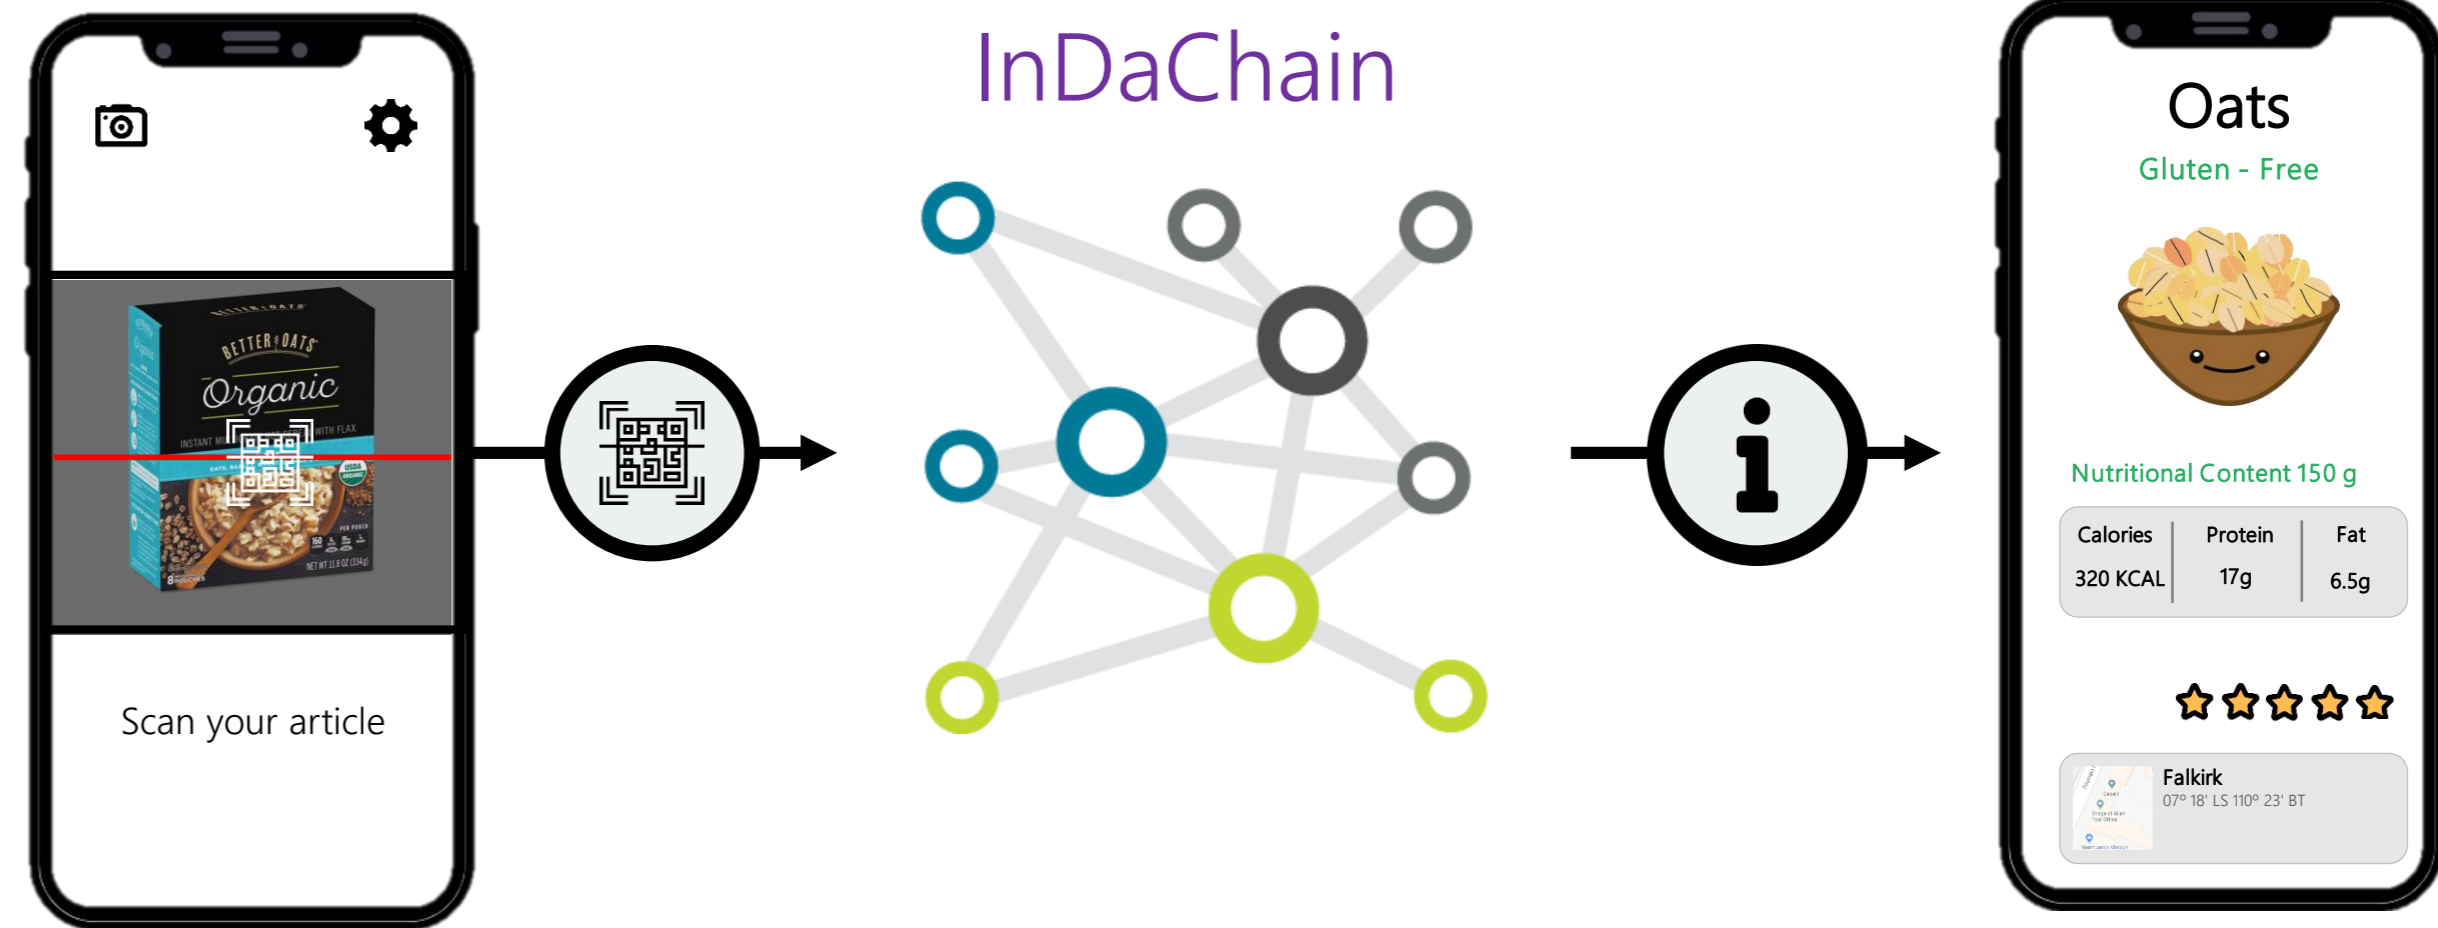

MSc in FinTech

What is the idea behind?

Have you ever wondered about the entire process of a vegetable or a fruit before the arrival to the supermarket's shelf? Here is your easy and transparent answer.

The aim of InDaChain is to create a fast way to access the information on the whole supply chain of a fresh product starting from the seeding cycle. It will be possible through the creation of an application compatible with Android and IOS devices.

Now, you are probably asking yourself why you should trust us and the information in the app. The answer is contained in the innovative technology we are going to use to store everything that the client will see on the screen. It is called Blockchain, and it is the technology of the next decade.

How the app works?

The app is really easy. You only need to register and login to access the functionalities. When you log in, you enter the home page where you can scan the QR code of the items.

The second tab will open immediately after the scanning process is executed. It will show the location and the main features stored on the blockchain regarding the supply chain of the product.

The final tab will be the standard label of the product so that the consumers can always access it even when the package is thrown away.
